

WECON VM AC Drive User Manual (V2.0)

Website: <http://www.we-con.com.cn/en>

Phone: 86-591-8786886

Date: May 23, 2022

:

Preface

Thank you for choosing WECON VM Series AC Drive.

This user manual introduces the technical specifications, installation instructions, functions and performance of VM Series AC Drive properly. Please read this user manual carefully before carrying out works such as installation, commissioning, maintenance, etc.

You are specially warned to read and understand safety precaution items of this manual before using this product, and to ensure that relevant electrical installation testers' professional qualification shall be in line with the provisions of the labor supervision department, and the electrical and environmental conditions for product use shall be in conformity with relevant national standards.

Be sure to verify that the wiring is correct before powering on the product. Before starting the product, it is necessary to debug to ensure correct motor rotating direction.

Contents

1 Safety precautions.....	- 1 -
2 Product information.....	- 1 -
2.1 Technical specifications.....	- 1 -
2.2 Product nameplate.....	- 1 -
2.3 Model description.....	- 1 -
2.4 Product model.....	- 1 -
3 Chapter 2 Installation.....	- 1 -
3.1 Overall structural drawing(unit: mm).....	- 1 -
3.2 Terminal connection.....	- 2 -
3.3 Main circuit connection.....	- 1 -
4 Display and operation.....	- 1 -
4.1 Keypad.....	- 1 -
4.2 Keypad Operation.....	- 1 -
5 Parameter function.....	- 1 -
5.1 Functional parameters.....	- 1 -
5.2 Monitoring Parameters.....	- 23 -
5.3 Main Error Codes and Solutions.....	- 24 -
6 Communication Protocol.....	- 25 -
6.1 RS485 Communication Registers.....	- 26 -

1 Safety precautions

■ Warning sign

 **DANGER:** Indicates that failure to comply with the notice will result in severe personal injury or even death.

 **WARNING:** Indicates that failure to comply with the notice will result in moderate personal injury, property damage or equipment damage.

WARNING

◎Do not install or operate any AC Drive that is damaged or with missing parts. Failing to follow this rule can result in facility damage or severe injury.

◎When installing or handling the AC Drive, please hold the bottom of the product rather than the case only, to prevent its falling and being damaged.

◎Install the AC Drive on nonflammable material like metal, and keep away from flammable or explosive object, heat source, and similar environment. Otherwise, fire may be caused.

◎When AC Drive is installed inside an electrical cabinet or other kind of enclosure, please install fans or other cooling devices, and keep ventilation well enough to ensure the enclosure temperature below 40℃, or the AC Drive may be damaged due to extreme high temperature.

◎Before wiring, ensure the AC Drive rated input voltage and phases are compatible with the input power source, or fire or personal injury may be caused.

◎Never connect the AC power supply to output terminals U, V and W. Otherwise, the AC Drive will be damaged and the warranty is invalid.

◎Never carry out withstand voltage test to the AC Drive, for example by a megohmmeter. Otherwise, it may cause damage to the AC Drive.

◎The connecting cable of the main circuit terminal should use an insulating sleeve.

◎When the cable length between the AC Drive and the motor exceeds 50 meters, an output reactor is recommended to be used.

◎Do not use a circuit breaker to control the start and stop of the AC Drive. Otherwise, the AC Drive may be damaged.

◎Since the AC Drive makes the motor running speed from low to high in a short time, please confirm that the motor and equipment are in the allowed running range before running.

◎Do not touch due to high temperature of the heat sink and braking resistor.

◎The factory parameters of the AC Drive can meet the requirements of most equipment operation. Under normal circumstances, please do not modify the AC Drive parameters at will. Even if there is some special applications need to change the AC Drive parameters, only necessary parameters could be changed. Otherwise, AC Drive damage may be caused.

◎The PCB board has a CMOS integrated circuit. Do not touch it with your hands, otherwise, static electricity will damage the PCB board.

DANGER

- ◎Wiring must be completed by qualified professional electricians, otherwise, there may be electric shock or damage to the AC Drive.
- ◎The power must be disconnected during wiring; otherwise, it may cause electric shock or fire.
- ◎The grounding terminal should be effectively grounded; otherwise, the outer casing of the AC Drive may be energized.
- ◎Do not touch the main circuit terminals, otherwise, it may cause electric shock.
- ◎Terminals for brake resistor are (+) and PB. Do not wire to other terminals, otherwise, fire may be caused.
- ◎It is only allowed to power on the AC Drive after the wiring is finished and its cover is reinstalled. It is strictly prohibited to remove the cover of AC Drive while power is on. Otherwise, it may cause electric shock.
- ◎Before programming the AC Drive with fault auto reset or restart option after power off, the mechanical device need to be implemented with safety protection measures first. Otherwise, personal injury will be caused.
- ◎“ STOP/RESET” key may become invalid as a result of some function setting. It is recommended to install an independent emergency circuit breaker for the AC Drive control system, otherwise, or personal injury may be caused.
- ◎When the power is on, there may be electricity in the AC Drive’s terminals even if it is in stop mode. Do not touch U, V, W terminals and motor connection terminals, or electrical shock may be caused.
- ◎Never touch the AC Drive connection terminals when power is on. Otherwise, it may cause an electrical shock.
- ◎Only qualified electricians can be authorized to do the jobs of maintenance, checking, or parts replacement.
- ◎After the power supply is OFF, make sure the charge LED is OFF and the residual voltage does not exist, or wait for at least 10 minutes before carrying out maintenance or inspection. Otherwise, damage or injury may be caused.
- ◎Modification to the AC Drive without permission is strictly prohibited, otherwise, severe injury may be caused. Arbitrarily modification of AC Drive will result in service warranty invalid.

2 Product information

2.1 Technical specifications

Input Frequency (Hz)	0-50/60 Hz
Output Voltage	3 Phase 0~Input Voltage
Output Frequency	0 to 1000Hz
Control Mode	V/F Control
Overload Ability	120% Rated Current: 1 min; 150% Rated Current: 10 secs
Protection Level	IP20
Altitude	Normal use below 1000m, derating 1% for every 100m rise above 1000m, up to 3000m
Ambient Temperature	-10℃ ~ +50℃ (IF the ambient temperature is between 40℃ and 50℃, please use with derating)
Humidity	<95%RH ,no condensation
Shock	<5.9m/s ² (0.6g)
Storage Temperature	-25℃ ~ 60℃

Table 2-1 Technical specifications

2.2 Product nameplate

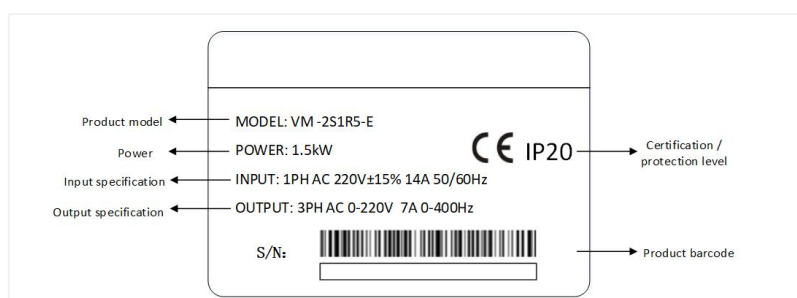

Figure 2-1 Product nameplate

2.3 Model description

VM – 2 S 1R5GB
 ① ② ③ ④

Field	No.	Identification	Description
Product series	①	Product series	VM series
Voltage grade	②	Voltage grade	2: 220VAC; 4: 380VAC
The input power	③	Power phase identification	S: single; T: three-phase
Rated power	④	Power range	1R5-1.5kW, R is the decimal point

Table 2-2 VM series model field commen

2.4 Product model

Model	Rated Power(kW)	Input Voltage	Rated Output Current(A)
VM-2SR75	0.75	Single Phase AC 220V±15%	4
VM-2S1R5	1.5		7
VM-2S2R2	2.2		9.6
VM-4TR75	0.75	3 Phase AC 380V±15%	2.5
VM-4T1R5	1.5		3.8
VM-4T2R2	2.2		5.1
VM-4T004	4		9
VM-4T5R5	5.5		13
VM-4T7R5	7.5		17

VM-4T7R5						

Table 3-1 Outline dimension

3.2 Terminal connection

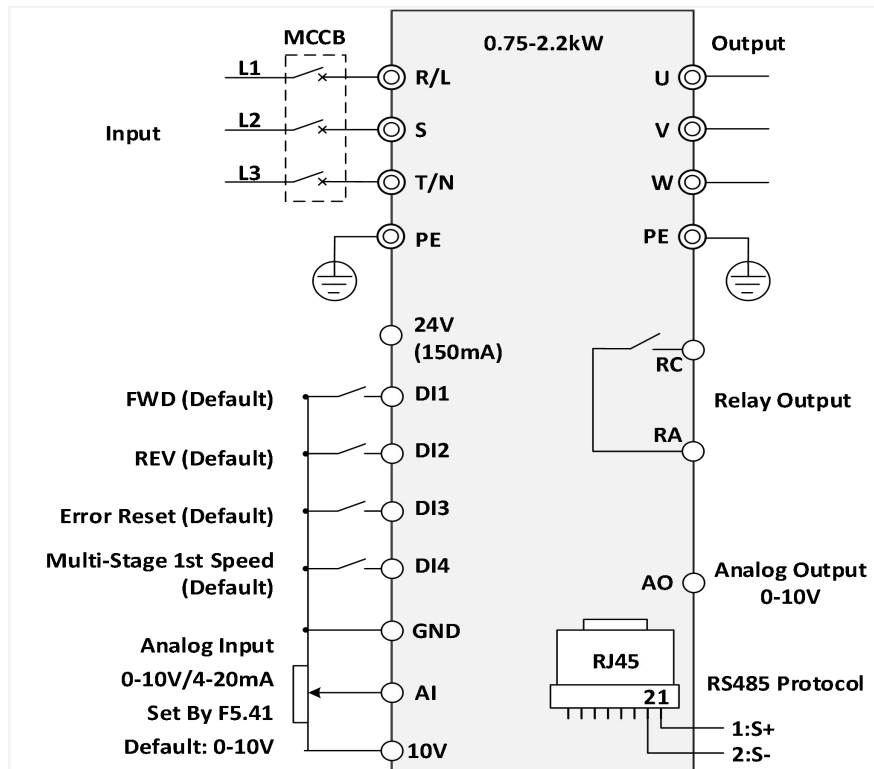

Figure 3-2 Terminal connection

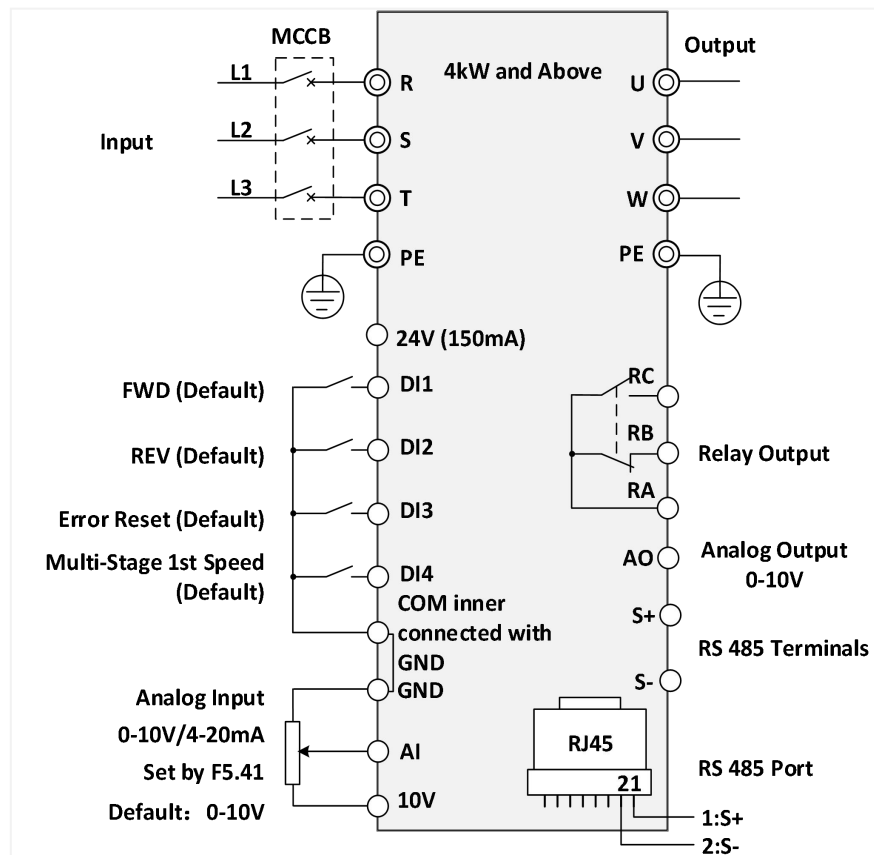

Figure 3-3 Terminal connectio

3.3 Main circuit connection

Terminal	Name	Description
R/L、S、T/N	Input Power	Connected to input power
U、V、W	Output Power	Connected to motor
	Grounding	Connected to ground
10V/GND	10V Power	Maximum Current: 20mA
24V/COM	24V Power	Maximum Current: 150mA
AI/GND	Analog Input	DC 0V ~ 10V or 0/4-20mA,set by parameter F5.41
AO/GND	Analog Output	0-10V
DI1/DI2 DI3/DI4	Digital Input	External digital signal input
RA/RB/RC	Relay Output	RA/RC NO,RA/RB NC
S+/S-	RS485 Communication	S+: Positive terminal of differential signal S-: Negative terminal of differential signal
RJ45 Port		As shown in the figure above; pin 1 is connected to S+, and pin 2 is connected to S-

Table 3-2 Main circuit terminals and function

4 Display and operation

4.1 Keypad

You can modify the parameters, monitor the working status and start or stop the AC Drive by operating the keypad, as shown in the following figure.

Figure 4-1 Keypad diagram

4.2 Keypad Operation

Item	Name	Function
Indicators	LED Indicators	RUN: On/Running,Off/Stopped REMOTE: On/Terminal Control,Off/Keypad Control,Blink/Communication Control FWD/REV: On/FWD,Off/REV,Blink/ FWD & REV Switching ALARM: Blink/Error,Off/Normal
Button	PRG	Enter or exit parameter setting
	ENT	Enter the parameters step by step、 save parameter
	△	Increase parameter or its value
	▽	Decrease parameter or its value
	>>	During parameter setting, select the modification bit of the parameter During stop/run monitoring, the display parameters can be selected cyclically
	RUN/STOP	In keypad operation mode, control run and stop It can be used for error reset when the drive alarms
Potentiometer	Speed Adjusting Potentiometer	Can be used for speed(frequency)adjusting

Table 4-1 Description of Indicators and key

5 Parameter function

“○” indicates that the set value of this parameter can be changed when the VFD is in stop or running state.

“●” indicates that the set value of this parameter cannot be changed when the VFD is running.

“◎” indicates that the value of this parameter is the actual detection record value and cannot be changed.

5.1 Functional parameters

Table 5-2 Monitoring Parameters

5.3 Main Error Codes and Solutions

Code	Description	Possible Causes	Solutions
ERR02	Overcurrent during acceleration	There is grounding or short circuit in the output circuit of the controller	Eliminate peripheral faults and check whether there is a short circuit at the motor end
		Acceleration time is set too short	Increase acceleration time
		The controller model is selected improperly(with too small power)	Select the controller that matches the motor power and load conditions
ERR03	Overcurrent during deceleration	There is grounding or short circuit in the output circuit of the controller	Eliminate peripheral faults and check whether there is a short circuit at the motor end
		Deceleration time is set too short	Increase deceleration time
ERR04	Overcurrent at constant speed	There is grounding or short circuit in the output circuit of the controller	Eliminate peripheral faults and check whether there is a short circuit at the motor end
		Controller model is too small	Select the controller that matches the motor power and load conditions
ERR05	Overvoltage during acceleration	Input voltage is too high	Adjust input voltage to a proper range
		Acceleration time is set too short	Increase acceleration time
		No braking unit and braking resistor installed	Install braking unit and braking resistor
ERR06	Overvoltage during deceleration	Input voltage is too high	Adjust input voltage to a proper range
		Deceleration time is set too short	Increase deceleration time
		No braking unit and braking resistor installed	Install braking unit and braking resistor
ERR07	Overvoltage at constant speed	Input voltage is too high	Adjust input voltage to a proper range
ERR08	Snubber resistor overload	The input voltage is not within the specified range	Adjust input voltage to a proper range
ERR09	Low input voltage	The input voltage is not within the specified range	Adjust input voltage to a proper range
		Abnormal bus voltage detection; abnormality of rectifier bridge, snubber resistor, drive board and control board	Seek for technical support
ERR10	VFD overload	Load is too large or motor is stuck	Reduce load and check motor and mechanical condition
		Controller model is too small	Select the controller that matches the motor power and load conditions
ERR11	Motor overload	The motor overload protection parameters (FA.01-FA.02) are not	Correctly set them

Code	Description	Possible Causes	Solutions
		properly set	
		Load is too large or motor is stuck	Reduce load and check motor and mechanical condition
ERR12	Input phase loss	Abnormal three-phase input power	Check and troubleshoot existing problems in peripheral circuits
		Failure of drive board or control board	Seek for technical support
ERR13	Output phase loss	Motor failure	Check if the motor winding is open
		The wirings between controller and motor is abnormal	Troubleshoot peripherals
		When the motor is running, the three-phase output of the controller is unbalanced	Check whether the three-phase windings of the motor are normal and troubleshoot
		Failure of IGBT or drive board	Seek for technical support
ERR14	IGBT overheat	Ambient temperature is too high	Lower ambient temperature
		Air duct blocked	Clear air duct
		Fan failure	Replace the fan
		Failure of thermistor or IGBT	Seek for technical support
ERR15	External alarm input	Input external fault signal through DI terminal	Clear external fault signal
ERR18	Current detection failure	Abnormal current detection circuit	Seek for technical support
		Control board failure	Seek for technical support
ERR21	Parameter R/W failure	Control board failure	Seek for technical support
ERR22	EEPROM failure	EEPROM chip failure	Seek for technical support

Table 5-3 Main Error Codes and Solutions

6 Communication Protocol

VM Series AC Drive provides RS485 communication interface and supports Modbus communication protocol. Users can achieve centralized control by computer or PLC, set AC Drive operation commands, modify or read function code parameters, read the working state and fault info of the AC Drive.

5.1 Communication Address Description

The communication address listed in the function code table is in the way of writing to RAM, and the data will not be saved after the VFD is powered off. During communication, for the write command "06H", if the parameters need to be stored in power-down, the way of writing to EEPROM should be used, and the original The "0" of the highest bit of the RAM address is changed to "F", and converted into the corresponding EEPROM address, such as: "0XXX" to "FXXX", address conversion example:

The upper limit frequency is F012, the communication address for writing RAM is: 000C, and the

address corresponding to EEPROM is: F00C.

Acceleration time F018, the communication address for writing RAM is: 0012, and the address corresponding to EEPROM is: F012.

It should be noted that the erasing life of EEPROM is about 1 million times. After the erasing times are exceeded, the reliability of data storage will be affected. If it is not necessary, it is recommended to use the method of writing RAM to control communication.

6.1 RS485 Communication Registers

Name	Address	Description	Data Remarks	Feature
Set Frequency	1000H	-10000 to 10000	$\pm 100.00\% * F0.10$	R/W
Control Command	2000H	0001: FWD Running	-	written only
		0002: REV Running	-	written only
		0003: FWD JOG	-	written only
		0004: REV JOG	-	written only
		0005: Free Stop(Coast to Stop)	-	written only
		0006: Deceleration Stop	-	written only
		0007: Error Reset	-	written only
Running Status	3000H	0001: FWD Running	-	read only
		0002: REV Running	-	read only
		0003: Stopped	-	read only
Monitoring Data	1001H	Running Frequency(Hz)	2 decimal places	read only
	1002H	Set Frequency(Hz)	2 decimal places	read only
	1003H	Bus Voltage(V)	1 decimal places	read only
	1004H	Output Voltage(V)	1 decimal places	read only
	1005H	Output Current(A)	2 decimal places	read only
	100DH	IGBT Temperature	1 decimal places	read only
	1008H	DI Input Status	DI1-DI4 Add up by binary bit	read only
	100CH	Keypad Potentiometer Voltage(V)	1 decimal places	read only
	100AH	AI Input Voltage(V)	1 decimal places	read only
	1000FH	Motor RPM	1 decimal places	read only
	1012H	PLC Stage	0-15	read only
Error Record	8000H	0000: No Error	-	read only
		0002: Overcurrent during acceleration	-	read only
		0003: Overcurrent during deceleration	-	read only
		0004: Overcurrent at constant speed	-	read only
		0005: Overvoltage during acceleration	-	read only
		0006: Overvoltage during deceleration	-	read only
		0007: Overvoltage at constant speed	-	read only
		0009: Low input voltage	-	read only
		000A: VFD overload	-	read only
		000B: Motor overload	-	read only
		000D: Output phase loss	-	read only
		000E: IGBT overheat	-	read only

Name	Address	Description	Data Remarks	Feature
		000F: External alarm input	-	read only
		0012: Current detection failure	-	read only
		0015: Parameter R/W failure	-	read only
Communication Failure Record	8001H	0000: No Error	-	read only
		0001: Command code error	-	read only
		0002: Communication transmission error	-	read only
		0003: CRC Check error	-	read only
		0004: Invalid Address	-	read only
		0005: Invalid Data	-	read only
		0006: Invalid parameter setting	-	read only
		0007: System Locked	-	read only
		0008: Parameter setting	-	read only
